PYTHON FOR DATA SCIENCE **CHEAT SHEET**

Python Basics

Datatypes

- Numbers: a=2(Integer),
- b=2.0(Float), c=1+2j(Complex)
- List: a=[1,2,3,'Word']
- Tuple: a= (1,2,4)
- String: a="New String"

[1,2],'b': [4,6]}

- Sets: a= {2,3,4,5}
- Dictionary: x= {'a':

Operators

Numeric Operator: (Say, a holds 5, b holds 10)

- a + b = 15
- b/a = 2

• a - b = -5

• b % a = 0

• a * b = 50

- a**b =9765625
- 7.0//2.0 = 3.0, -11//3 = -4

Comparison Operator:

- (a == b): not true
- (a > b): not true
- (a!= b): true
- (a >= b): not true
- (a > b): not true
- (a <= b) is true

Boolean Operator:

- a and b
- a or b
- not a

Functions

def new_function():

Operations

List Operations

- list=[]: Defines an empty list
- · list[i]=a: Stores a at the ith position
- list[i]: Retrieves the character at the ith position
- list[i:j]: Retrieves characters in the range i to j
- list.append(val): Adds item at the end
- list.pop([i]): Removes and returns item at index i

String Operations

- String[i]: Retrieves the character at the ith position
- String[i:j]: Retrieves characters in the range i to j

Dictionary Operations

- · dict={}: Defines an empty dictionary
- · dict[i]=a: stores "a" to the key "i"
- dict[i]: Retrieves the item with the key "i"
- dict.key: Gives all the key items
- dict.values: Gives all the values

0 O P S

Inheritance:

A process of using details from a new class without modifying existing class.

Polymorphism:

A concept of using common operation in different ways for different data input.

Encapsulation:

Hiding the private details of a class from other objects.

Class/object

Class: Object:

class Pen: pass

FlowControlMethod

If-else (Conditional Statement)

obj=Pen()

if price>=700: print("Buy.")

else:

print("Don't buy.")

For loop (Iterative Loop Statement)

a="New Text" count=0 for i in a: if i=='e':

count=count+1

print(count)

While loop (Conditional Loop Statement)

a=0 i=1 while i <10: a=a*2 j=j+1 print(a)

Loop Control: Break, Pass and continue

print("Hello World")

new_function()

LambdaFunction

lambda a,b: a+b

lambda a,b: a*b

Comments

Single Line Comment

Multi-line comment

GenericOperations

- range(5): 0,1,2,3,4
- S=input("Enter:")
- Len(a): Gives item count in a
- min(a): Gives minimum value in a
- max(a): Gives minimum value in a
- sum(a): Adds up items of an iterable and returns
- sorted(a): Sorted list copy of a
- importing modules: import random

FileOperations

f= open("File Name","opening mode")

(Opening modes: r: read, w: write, a: append, r+: both read

Try&ExceptBlock

[Statement body block] raise Exception()

except Exception as e:

[Error processing block]
